1 Polynomial Practice

Note 8

(a) If f and g are non-zero real polynomials, how many roots do the following polynomials have at least? How many can they have at most? (Your answer may depend on the degrees of f and g.)

   (i) $f + g$

  (ii) $f \cdot g$

 (iii) f/g, assuming that f/g is a polynomial

(b) Now let f and g be polynomials over $\mathrm{GF}(p)$.

   (i) We say a polynomial $f = 0$ if $\forall x, f(x) = 0$. Show that if $f \cdot g = 0$, it is not always true that either $f = 0$ or $g = 0$.

  (ii) How many f of degree *exactly* $d < p$ are there such that $f(0) = a$ for some fixed $a \in \{0, 1, \ldots, p-1\}$?

(c) Find a polynomial f over $\mathrm{GF}(5)$ that satisfies $f(0) = 1, f(2) = 2, f(4) = 0$. How many such polynomials of degree at most 4 are there?

Solution:

(a)   (i) It could be that $f + g$ has no roots at all (example: $f(x) = 2x^2 - 1$ and $g(x) = -x^2 + 2$), so the minimum number is 0. However, if the highest degree of $f + g$ is odd, then it has to cross the x-axis at least once, meaning that the minimum number of roots for odd degree polynomials is 1. On the other hand, $f + g$ is a polynomial of degree at most $m = \max(\deg f, \deg g)$, so it can have at most m roots. The one exception to this expression is if $f = -g$. In that case, $f + g = 0$, so the polynomial has an infinite number of roots!

  (ii) A product is zero if and only if one of its factors vanishes. So if $f(x) \cdot g(x) = 0$ for some x, then either x is a root of f or it is a root of g, which gives a maximum of $\deg f + \deg g$ possibilities. Again, there may not be any roots if neither f nor g have any roots (example: $f(x) = g(x) = x^2 + 1$).

 (iii) If f/g is a polynomial, then it must be of degree $d = \deg f - \deg g$ and so there are at most d roots. Once more, it may not have any roots, e.g. if $f(x) = g(x)(x^2 + 1)$, $f/g = x^2 + 1$ has no root.

(b) (i) There are a couple counterexamples:

Example 1: $x^{p-1} - 1$ and x are both non-zero polynomials on $GF(p)$ for any p. x has a root at 0, and by FLT, $x^{p-1} - 1$ has a root at all non-zero points in $GF(p)$. So, their product $x^p - x$ must have a zero on all points in $GF(p)$.

Example 2: To satisfy $f \cdot g = 0$, all we need is $(\forall x \in S, f(x) = 0 \lor g(x) = 0)$ where $S = \{0, \ldots, p-1\}$. We may see that this is not equivalent to $(\forall x \in S, f(x) = 0)) \lor (\forall x \in S, g(x) = 0)$.

To construct a concrete example, let $p = 2$ and we enforce $f(0) = 1, f(1) = 0$ (e.g. $f(x) = 1 - x$), and $g(0) = 0, g(1) = 1$ (e.g. $g(x) = x$). Then $f \cdot g = 0$ but neither f nor g is the zero polynomial.

(ii) We know that in general each of the $d+1$ coefficients of $f(x) = \sum_{k=0}^{d} c_k x^k$ can take any of p values. However, the conditions $f(0)$ and $\deg f = d$ impose constraints on the constant coefficient $f(0) = c_0 = a$ and the top coefficient $x_d \neq 0$. Hence we are left with $(p-1) \cdot p^{d-1}$ possibilities.

(c) A polynomial of degree ≤ 4 is determined by 5 points (x_i, y_i). We have assigned three, which leaves $5^2 = 25$ possibilities. To find a specific polynomial, we use Lagrange interpolation:

$$\Delta_0(x) = 2(x-2)(x-4) \qquad \Delta_2(x) = x(x-4) \qquad \Delta_4(x) = 2x(x-2),$$

and so $f(x) = \Delta_0(x) + 2\Delta_2(x) = 4x^2 + 1$.

2 Interpolation Practice

Find the lowest degree polynomial with coefficients in $\mathbb{R}$ that passes through the points $(0,0), (1,2)$, and $(2,-1)$. Now do it again in, with coefficients in GF(3).

Solution:

Using Lagrange interpolation, we need to compute first the polynomial $\Delta_0(x)$ satisfying $\Delta_0(0) = 1$, $\Delta_0(1) = 0$, and $\Delta_0(2) = 0$, and then the analogous ones Δ_2 and Δ_3. To do this we'll set

$$\Delta_0(x) = \left((0-1)(0-2)\right)^{-1}(x-1)(x-2) = 2^{-1}\left(x^2 - 3x + 2\right)$$
$$\Delta_1(x) = \left((1-0)(1-2)\right)^{-1}(x-0)(x-2) = (-1)^{-1}\left(x^2 - 2x\right)$$
$$\Delta_2(x) = \left((2-0)(2-1)\right)^{-1}(x-0)(x-1) = 2^{-1}\left(x^2 - x\right).$$

The polynomial $f(x)$ with real coefficients passing through the points we want will then be

$$f(x) = 0 * \Delta_0(x) + 2 * \Delta_1(x) - 1 * \Delta_2(x) = -\frac{5}{2}x^2 + \frac{9}{2}x.$$

To do this over GF(3), all we need to do is take the polynomial we just computed and reduce it modulo 3. Since $2^2 = 4 \equiv 1 \mod 3$, 2 is it's own multiplicative inverse, $-5/2 \equiv -10 \equiv 2 \mod 3$, and we'll get

$$g(x) = 2x^2.$$

3 Secrets in the United Nations

A vault in the United Nations can be opened with a secret combination $s \in \mathbb{Z}$. In only two situations should this vault be opened: (i) all 193 member countries must agree, or (ii) at least 55 countries, plus the U.N. Secretary-General, must agree.

(a) Propose a scheme that gives private information to the Secretary-General and all 193 member countries so that the secret combination s can only be recovered under either one of the two specified conditions.

(b) The General Assembly of the UN decides to add an extra level of security: each of the 193 member countries has a delegation of 12 representatives, all of whom must agree in order for that country to help open the vault. Propose a scheme that adds this new feature. The scheme should give private information to the Secretary-General and to each representative of each country.

Solution:

(a) Create a polynomial of degree 192 and give each country one point. Give the Secretary General $193 - 55 = 138$ points, so that if she collaborates with 55 countries, they will have a total of 193 points and can reconstruct the polynomial. Without the Secretary-General, the polynomial can still be recovered if all 193 countries come together. (We do all our work in GF(p) where $p \geq d+1$).

Alternatively, we could have one scheme for condition (i) and another for (ii). The first condition is the secret-sharing setup we discussed in the notes, so a single polynomial of degree 192 suffices, with each country receiving one point, and evaluation at zero returning the combination s. For the second condition, create a polynomial f of degree 1 with $f(0) = s$, and give $f(1)$ to the Secretary-General. Now create a second polynomial g of degree 54, with $g(0) = f(2)$, and give one point of g to each country. This way any 55 countries can recover $g(0) = f(2)$, and then can consult with the Secretary-General to recover $s = f(0)$ from $f(1)$ and $f(2)$.

(b) We'll layer an *additional* round of secret-sharing onto the scheme from part (a). If t_i is the key given to the ith country, produce a degree-11 polynomial f_i so that $f_i(0) = t_i$, and give one point of f_i to each of the 12 delegates. Do the same for each country (using different f_i each time, of course).
